X!Tandem Pipeline
Automated analyses, filtering and export of X!Tandem MS/MS results

06 June 2012

Abstract

X!Tandem is an open-source software performing peptide/protein identification from MS/MS mass spectra. X!Tandem is fast and accurate, but the Global Proteome Machine (GPM) is relatively limited regarding the processing of identification results. **X!Tandem Pipeline** is an alternative to the installation of the GPM on local servers.

X!Tandem Pipeline performs database searching and matching on a list of MS/MS runs in one shot, using a list of easily user selected paramaters and databases.

X!Tandem Pipeline also performs filtering of data according to statistical values at peptide and protein levels. Moreover, redundancy of protein databases are fully filtered as follows :

- proteins identified without specific peptides compared to others are eliminated;
- proteins identified with the same pool of peptides are assembled;
- proteins are grouped by function (identified with at least one common peptide), and the specific peptides for each sub-group of proteins are indicated.

X!Tandem Pipeline allows to view and edit the filtered results, compute the false discovery rate, ... The results can be exported into TSV (Tab Separated Values) files.

Contents

1 Installation

1.1 License

Copyright (C) 2010 Valot Benoit and Olivier Langella

X!Tandem Pipeline program is free software: you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation, either version 3 of the License, or (at your option) any later version.

This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.

1.2 Requirements

X!Tandem Pipeline works on all platforms (Linux, Windows and Mac). Java 1.6 must be installed (it can be found : here).

1.3 Third party softwares for Windows and Mac

Download the X!Tandem executable from the GPM site.

1.4 Third party softwares for Linux

Ubuntu

- Add this repository.

- Install the *xtandem-cyclone* package.

- You can also install the *xtandempipeline* package to run **X!Tandem Pipeline**rather than used jlnp link.

Other distributions

- Download the sources and follow the instruction of compilation.
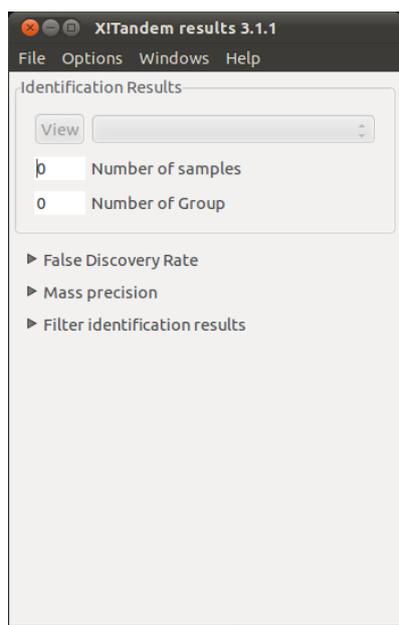

Figure 1: Principal window

1.5   Start X!Tandem pipeline

To run **X!Tandem Pipeline**, simply :

- Open X!Tandem pipeline by using this link

- Wait for the program to execute

- The principal window will appear (Fig 1)

1.6   Configuration

At the firt start, the application open the configuration path window:

- Open the menu *Option → Configuration Path* (Fig 2).

- Define the path to the X!Tandem executable

- Choose the folder where to store the X!Tandem parameters (or used default one).

- Choose the folder where the MS/MS data, the protein databases and the X!tandem results are stored
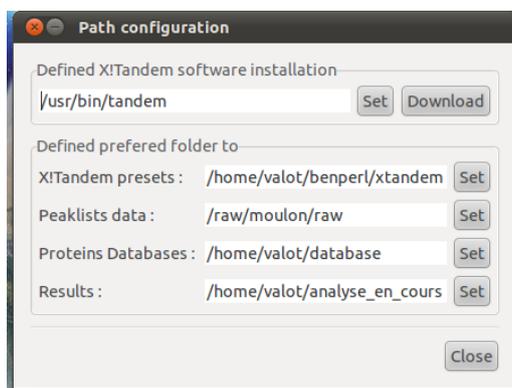

Figure 2: Configuration window

2   X!Tandem analysis

X!Tandem Pipeline allows you to analyze peak-lists files by searching a list of protein databases using the X!Tandem software. Three successive graphical boxes help you select first the mzXML files or other peak-lists, then the protein databases and finally the folder where the results will be stored. The databases must be protein ones, X!Tandem does not work on DNA databases.

2.1   Parameters

To perform database searching, you must create or edit a model XML file (stored in the xtandem models folder). Open the menu *Option → X!Tandem preset* (Fig 3).
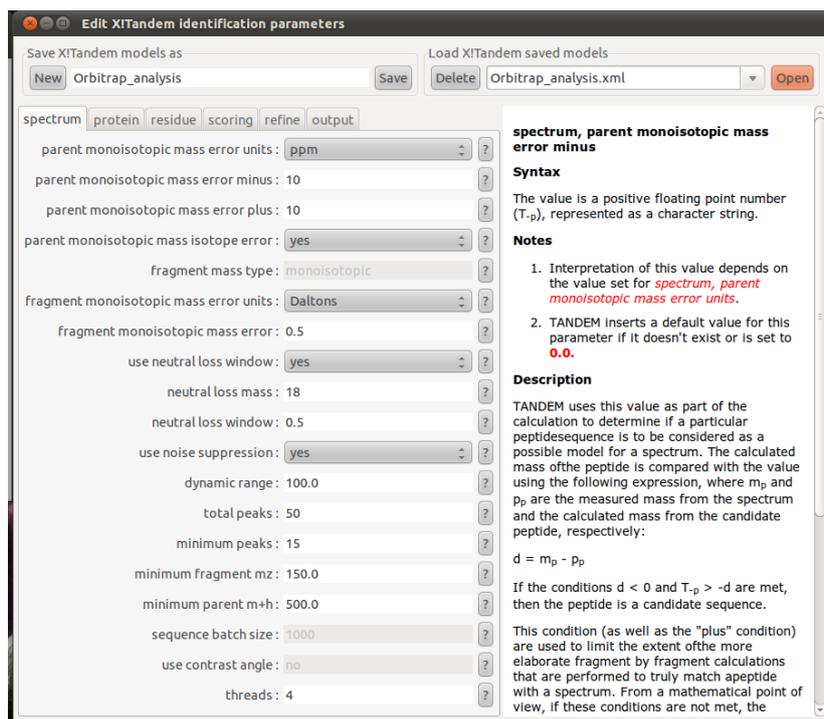

Figure 3: X!Tandem preset window

To use complete performance of your computer, specify the number of CPU in the model : spectrum → threads.

2.2   Running analysis

To perform analysis, start the menu *File → X!Tandem → Analysis*. Select on the window (Fig 4) :

1. Peak-list files to be analyzed (See 2.3)

2. Database files to be searched (See 2.4)

3. Searching parameters model (See 2.1)

4. Folder where to store the result files

2.3   Peak-lists

X!Tandem works with open peak-list files like mzXML, mgf, mzData, mzML or pkl files.

2.4 Databases

X!Tandem software uses only protein databases in fasta format. It doesn't work with EST[1] sequences. You can transform your database using our application *Protein database manager*, available here, or you can directly run it here.
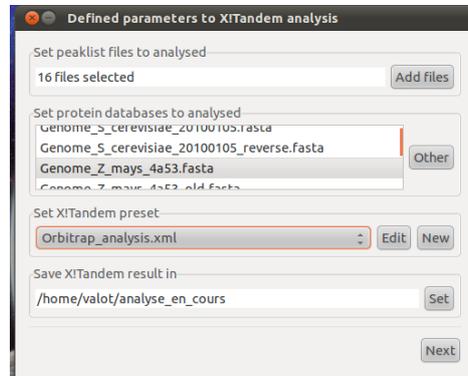

Figure 4: X!Tandem parameter window

---

[1]Expressed Sequenced tag

3 Processing the results

Warning: To process results, **X!Tandem Pipeline** needs to have X!Tandem result files (.xml). The names of the files are used as **sample names**.

3.1   Three modes of analysis

You can filter the MS/MS identification results and export them in three different modes : (menu *File →
Load Result*)

Individual mode
> Each MS/MS result file is processed individually.
> You cannot perform comparison by using this process.

Combined mode
> The MS/MS result files are combined in one result file, and this file is filtered / exported.
> This mode is useful to compare different results.

Phosphopeptide mode
> Same as the combined mode analysis except that only phosphopeptides are conserved and the result is
> oriented in order to validate phosphosites.

In all modes, you have to defined the filter parameters.

3.2   Filter parameters

The filter window (Fig 5) defines the automated filtering process parameters :

Add files
> At this stage, you can add other MS/MS result files to the analysis. If two files have the same name, they are
> combined in one result file. Interesting if one wants to combine X!Tandem results of the same LC-MS/MS run
> using different modification parameters or protein databases.

Peptide E-value
> Defines the E-value above which a peptide is considered as valid.

Peptide number
> Defines the number of valid unique[2] peptides necessary to validate a protein.

Protein E-value
> Defines the E-value above which a protein is considered as valid.
>
> - The protein E-value is the product of its valid unique peptide E-values and it is different from the protein
>   E-values determined by X!Tandem.
> - The values are expressed in log(E-value).

Sum to all
> Defines how protein filter is performed when MS/MS results are combined :
>
> **No** To validate a protein, the 2 parameters (peptide number and protein E-value) must be valid in at least one
>   result. Interesting if one wants to compare SDS-PAGE-LC-MS/MS results, where peptides from a protein
>   are in the same LC-MS/MS run.
>
> **Yes** To validate a protein, the 2 parameters (peptide number and protein E-value) must be valid in the sum of all
>   results. Interesting if one wants to compare 2DLC-MS/MS results, where peptides from a protein are split
>   in different LC-MS/MS runs.

Contaminants
> When you perform an analysis using different fasta databases, you can remove the result from one database by
> selecting this database. Interesting because it allows you to always include the same contaminant proteins during
> the database search, and because it removes the contaminant proteins from the results.

---

[2]Unique peptides are defined as peptides with different sequences. This excludes peptides with different modifications.
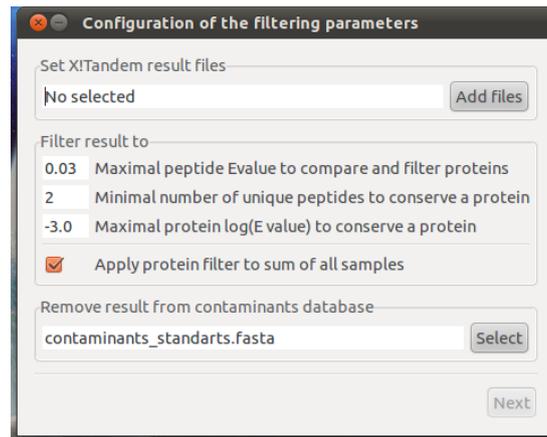

Figure 5: Filter window

4   View and edit the results

After loading the results, you can select the result to view in the principal window (Fig 1). After this selection, you can navigate in this result in four different windows listed in the menu *Windows* :

4.1   Proteins List

View the list of protein identified on the result. For more details on column see Fig 11.

- Filter the protein by description;

- Clic on a protein to view the corresponding peptides list (see 4.3) and protein details (see 4.2);

- Unchecked protein for unvalidate the corresponding peptides;

- **Applied modification** to validate the edition.

Figure 6: Proteins List

4.2   Protein Details

View the protein sequence and coverage on a identified protein. To view this window, you must open it in the menu *Windows → Protein details*.
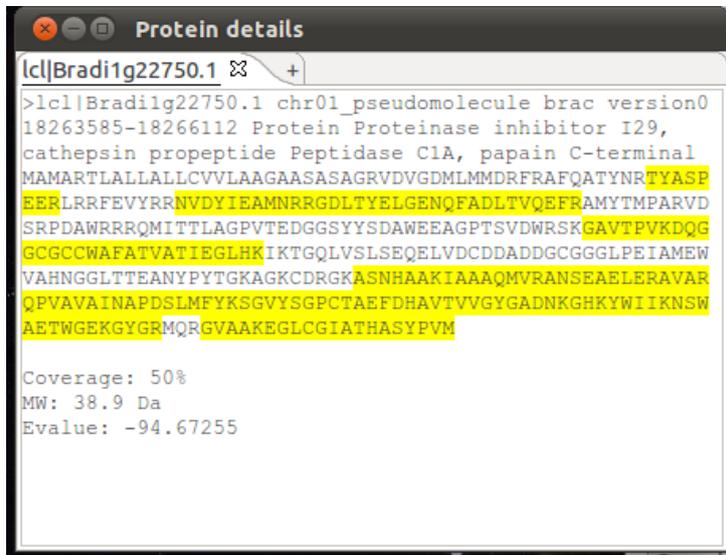

Figure 7: Protein details

4.3   Peptides List

View the peptides identified a protein. For more details on column see Fig 12.

- Filter the peptide by different options;
- Clic on a peptide to view the corresponding MS/MS spectra (see 4.4);
- Unchecked peptide for unvalidate it.
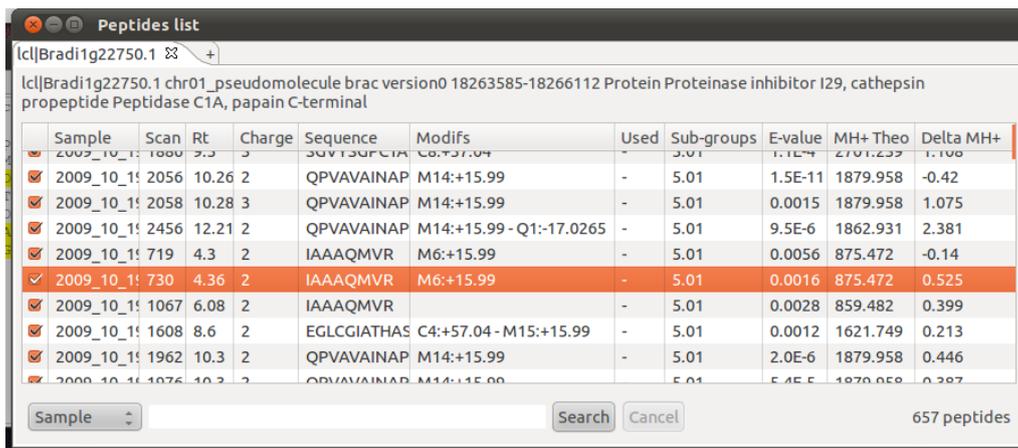

Figure 8: Peptides List

4.4   Peptides Details

View the MS/MS spectra of an identified peptide.

- Clic on spectra to zoom.

- Save MS/MS annotated spectra on png or svg.
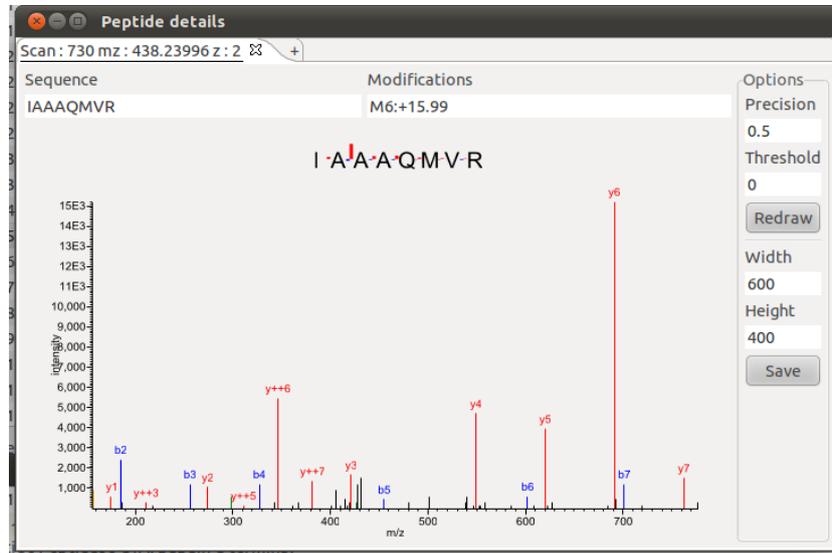

Figure 9: Peptides Details

5 Save and Load X!Tandem Pipeline project

You can save all the current results using menu *File → Save Project*, or load an previous one using menu *File → Load Project*. The extension of created files is **.xpip*.

6   Exporting the results

You can export the result in different formats in menu *File → Export.*

6.1   Export parameters

The export window (Fig 10) shows the different types of available exports :

Default
> Creates TSV files containing identification results for proteins (*protein.txt) and peptides (*peptide.txt). When you perform a combined analysis, a *compar.txt file is created that contains the results of comparison between samples.

Fasta
> Creates a fasta file for valid proteins.

PepNovo
> Creates a XML file containing the peptide results to be removed for an automated *De Novo* interpretation in sequence using our DeNovo pipeline.

FDR
> Creates two tabulated files containing the number of valid peptides or valid proteins for the different E-values in each database. Allows you to determine the E-value above which FDR value is acceptable.

Protic
> Creates a PROTICdb compatible XML file, so you can store results in the PROTICdb proteomic database.

MassChroQ
> Creates a MassChroQ compatible XML file, so you can perform quantitative analysis using our home-made software **MassChroQ** (to be released soon).
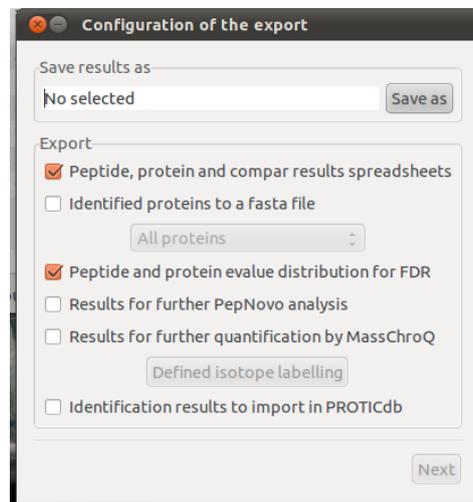

Figure 10: Export window

6.2   Files *protein.txt

The identified proteins are represented by sample (individual mode) or for all samples (combine/phosphopeptide modes) (Fig 11). Proteins are grouped by function.

Group Group to which the protein belongs. All the proteins in a group have at least one peptide in common.

Sub-group Sub-group to which the protein belongs. All the proteins in a sub-group are identified with the same valid peptides.

Description Protein description as it appears in the header of the fasta file.

log(E value) Protein E-value expressed in log.

- Statistical value representing the number of times this protein would be identified randomly.

- Calculated as the product of unique peptide E-values in the sample.

Coverage % of protein coverage.

MW Molecular weight of the protein expressed in KDa.

Spectra Total number of MS/MS spectra identified for the protein

Specifics Number of MS/MS spectra that are specific to the protein, compared to the other proteins of the same group (individual and phosphopeptide mode, see 3.1).

Specific uniques Number of unique peptide sequences specific to the protein, compared to other proteins of the same group (combined mode, see 3.1).

Uniques Number of unique peptide sequences identified for the protein.

PAI Protein Abundance Index :

- PAI estimates the relative abundance of the protein.

- PAI is calculated as the number of identified spectra divided by the number of theoretical peptides[3] of the protein.

Redundancy Number of proteins identified with the same pool of spectra. When there is redundancy, the above described parameters are shown only for the first protein of the subgroup (arbitrary chosen).Only the description of the other members of the subgroup is shown.

Position Position(s) of the phosphosite in the protein. This value is only reported in phosphosite mode (see 3.1).

Figure 11: Protein results

6.3   Files *peptide.txt

Identified peptides are grouped by group (Fig 12). One line corresponds to one MS/MS spectrum identifying one peptide that can be present in one or more proteins.

Group Group of the proteins containing this peptide.

Description Protein description if the peptide is specific to this protein.

Sample Name of the MS/MS run file.

Scan Scan number of the MS/MS run analysis.

Rt Retention time of the peptide.

Sequence Sequence of the peptide.

Modifs Modifications on the peptide. [4]

Valid Indicates whether the peptide was validated by the filter parameters or not.

Used Number of protein sub-groups in which the peptide is present.

on a total of Total number of protein sub-groups in the group.
    Rq : If the peptide is specific, there is only $'-'$.

---

[3]Theoretical peptides correspond to the peptides resulting from the theoretical digestion of the protein sequence by trypsin and that are visible in mass spectrometry ($800 < MH < 2500$)

[4]For example, M2:+15.99 means that the mass of the second amino acid, which is a methionine, is increased by 15.99. This mass increase indicates that the peptide is oxidized.

Sub-groups Protein sub-groups where the peptide is present.

E-value Peptide E-value.

- Statistical value representing the number of times this peptide would be identified randomly.
- Calculated by X!Tandem with an empiric model.

Charge Charge level of the precursor.

MH+ Obs Monoisotopic observed mass for the peptide + one proton (MH^+)

MH+ Theo Monoisotopic calculated mass for the peptide + one proton (MH^+)

DeltaMH+ Error in the precursor mass between observed and theoretical data (Da)

Delta-ppm Error in the precursor mass between observed and theoretical data (ppm)

Position Position(s) of the phosphosite in the protein. This value is only reported in phosphosite mode (see 3.1).

Figure 12: Peptide results

6.4   Files *compar.txt

All identified proteins are represented in a list: one protein per row, and one sample per column (Fig 13). The list of proteins is repeated 4 times, corresponding to the 4 parameters that are used to compare samples (see Type for details).

Group Protein group. Groups roughly correspond to the different functions.

Sub-group Protein sub-group. All the proteins of a sub-group are identified with the same valid peptides.

Description Protein description extracted from the fasta file.

MW Molecular weight of the protein (KDa).

log(E value) The log of protein's E-value.

- Statistical value representing the number of times this protein would be identified randomly.
- Calculated as the product of unique peptide E-values in all sample.

Type The item that is compared between samples.

 Spectra Number of MS/MS spectra identified for the protein.

 Specifics Number of specific MS/MS spectra identified for the protein compared to the other proteins belonging to the same group.

 Uniques Number of unique peptide sequences identified for this protein.

 PAI Protein Abundance Index (6.2).

Position Position(s) of the phosphosite in the protein. This value is only reported in phosphosite mode (see 3.1).

Figure 13: Comparison results

6.5   Files *fdr.txt

This result file indicates the number of peptides with an E-value less than the E-value indicated in the fist column (Fig 14). You just have to divide the number of peptides in the reverse or decoy database by the number of peptides in the normal database to obtain the false discovery rate at each E-value level.
This method could be performed if :

- normal and reverse databases must be saved in different fasta files;

- X!tandem analysis have been performed with reverse option.
  In this case, the column corresponding to the normal and reverse search are indicated as *xtandem normal* and *xtandem reverse*, respectively.

FDR on peptide identification		
Evalue	Normal.fasta	Reverse.fasta
−14.5	0	0
−14	0	0
−13.5	1	0
−13	1	0
−12.5	1	0
−12	3	0
−11.5	3	0
−11	4	0
−10.5	4	0
−10	6	0
−9.5	6	0
−9	7	1
−8.5	7	1

7   Changelog

7.1   "Myosine" branch

3.3.0 Grouping of sub-group have been changed to enhanced rapidity and corrected over-grouping on large dataset (thanks to M. Blein)
If you have very large dataset, we recommand to reload xtandem results to corrected error.

7.2   "Tubuline" branch

3.2.2 Corrected report of input parameter on X!Tandem output result (thanks to T. Greko).

3.2.1 Add new X!Tandem paramaters for multiple search of modifications in one analyse and calculation can now be performed on z ¿ 3.

3.2.0 Identification from Mascot dat file can now be imported and filtered. All work as X!Tandem result excepts that protein sequence can not be retrieved : PAI and coverage are absent.
Correction of FDR calculation from Reverse/Decoy search.

7.3   "Kératine" branch

3.1.5 Add support of phosphorylation neutral loss and enhanced ETD detection on MS2 spectra.
Correction of MassChroQ export.

3.1.4 Add support for viewving ETD spectra after automatic detection.

3.1.3 Corrected bug of xtandem preset. Refine analysis was never start instead refine param is set to yes.
Adds a new annotated spectrum renderer and bug fix on ODS export.

3.1.2 Add export results on Open Document Spreadsheet (.ods) file.
Correction of bugs (Grouping, PepNovo export, ...).

3.1.1 FDR computation are now compatible with reverse option of X!Tandem.

3.1.0 Algorithm of grouping have been completly rewritten :

- Older project must be refiltered to be properly grouped.
- Phosphopeptide filtering have been enhanced to correspond to :
    - SubGroup represents the number of phosphosites
    - Group represents the number of phosphoproteins
- Configuration file have been modified and must be parameter again
